DETAILED ACTION

Response to Amendment

- Examiner acknowledges Applicant's response filed 5 November 2007 containing amendments to the claims and remarks.
- 2. Claims 1-18 and 20-24 are pending.
- 3. Examiner acknowledges that Applicant's amendment to claims 7, 14-16, and 18 are sufficient to overcome the previous objections.
- 4. The previous rejections of claims 1-13 and 19-22 under 35 U.S.C. 102(b) are maintained. Likewise, the previous rejections of claims 14-18, 23, and 24 under 35 U.S.C. 103(a) are maintained.
- 5. Finally, the previous rejections of claims 3, 13-19, and 24 on the basis of nonstatutory obviousness-type double patenting are maintained. The rejections follow.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office Action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 7. Claims 1-13 and 20-22 are rejected under 35 U.S.C. 102(b) as being anticipated by Gravley (US 4,765,964).

10/806,232 Art Unit: 1797

- 8. With respect to claim 1, Gravley discloses a process for the scale-up of a reactor having a supply of a reaction mixture via channels of a burner block to a reaction chamber (column 3, lines 15-16), a high temperature reaction having a short residence time taking place in the reaction chamber (column 7, lines 56-60) and the reaction mixture subsequently being rapidly cooled in a quench area (column 6, lines 37-39), characterized in that for a throughput enlargement the internal diameter of the reactor is enlarged (see Table I, runs 8 and 9), the transition from the reaction chamber to the quench area being designed in the form of a gap (see Figure) which is restricted to a width in the range from 2 to 200 mm (column 6, lines 31-34, and column 10, line 39).
- 9. With respect to claim 2, Gravley discloses a transition of the reaction chamber to the quench area restricted to a gap having a width in the range from 50 to 150 mm (column 6, lines 31-34, and column 10, line 39).
- 10. With respect to claim 3, Gravley discloses a reactor having a supply of a reaction mixture via channels of a burner block to a reaction chamber (column 3, lines 15-16), a high temperature reaction having a short residence time taking place in the reaction chamber (column 7, lines 56-60) and the reaction mixture subsequently being rapidly cooled in a quench area (column 6, lines 37-39), characterized in that the transition of the reaction chamber to the quench area is designed in the form of an annular gap (see Figure).
- 11. With respect to claim 4, Gravley discloses an annular gap restricted to a width in the range from 2 to 200 mm (column 6, lines 31-34, and column 10, line 39).

10/806,232 Art Unit: 1797

- 12. With respect to claim 5, Gravley discloses a reaction chamber designed in the form of an annular gap (see Figure).
- 13. With respect to claims 6 and 7, Gravley discloses channels of the burner block aligned in the longitudinal axis of the reaction chamber (23).
- 14. With respect to claim 8, Gravley discloses the quench area constructed aligned in the direction of the longitudinal axis of the reaction chamber (see Figure).
- 15. With respect to claim 9, Gravley discloses rapid cooling of the reaction mixture in the quench area brought about by direct or indirect quenching (column 6, lines 37-39).
- 16. With respect to claim 10, Gravley discloses direct quenching brought about by single or multistage mixing of a cooling medium into the reaction mixture (column 6, lines 37-56).
- 17. With respect to claims 11, Gravley discloses direct quenching brought about by direct mixing of cooling medium into the quench area designed like an annular gap from outside (see Figure).
- 18. With respect to claim 12, Gravley discloses direct quenching brought about by introducing a cooling medium via quench nozzles arranged radially or tangentially to the main flow direction of the reaction mixture in the reactor (see Figure).
- 19. With respect to claim 13, Gravley discloses wherein all surfaces restricting the reaction chamber are formed of a fire-resistant ceramic having an alumina content of at least 80% by weight (column 5, lines 49-53).

10/806,232 Art Unit: 1797

20. With respect to claim 20, Gravley discloses wherein the annular gap is restricted to a width in the range from 50 to 150 mm (column 6, lines 31-34, and column 10, line 39).

- 21. With respect to claim 21, Gravley discloses wherein a quench area is constructed as a gap (see Figure).
- 22. With respect to claim 22, Gravley discloses wherein the gap has an annular shape (see Figure).

Claim Rejections - 35 USC § 103

- 23. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office Action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 24. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 25. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of

10/806,232 Art Unit: 1797

the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

- 26. Claim 23 is rejected under 35 U.S.C. 103(a) as being upatentable over Gravley (US 4,765,964). Alternatively, claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gravley (US 4,765,964) in view of Kuehner (US 5,188,806).
- 27. With respect to claim 23, Gravley discloses a reactor having a supply of a reaction mixture via channels of a burner block to a reaction chamber (column 3, lines 15-16), a high temperature reaction having a short residence time taking place in the reaction chamber (column 7, lines 56-60) and the reaction mixture subsequently being rapidly cooled in a quench area (column 6, lines 37-39), characterized in that the transition of the reaction chamber to the quench area is designed in the form of an annular gap (see Figure); an annular gap restricted to a width in the range from 2 to 200 mm (column 6, lines 31-34, and column 10, line 39); and direct quenching brought about by single or multistage mixing of a cooling medium into the reaction mixture (column 6, lines 37-56).

Gravley does not disclose direct quenching brought about by single or multistage mixing of a cooling medium into the reaction mixture via one or more annular distributors.

10/806,232 Art Unit: 1797

However, direct quenching via annular distributors is known in the art (see e.g., Kuehner (US 5188806), column 3, lines 66-68, and column 4, lines 1-7).

Therefore, it would have been obvious to the person having ordinary skill in the art at the time the invention was made to provide direct quenching of the reaction mixture by means of an annular distributor.

- 28. Claims 14-18, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gravley (US 4765964) in view of Bakker (US 3640739).
- 29. With respect to claims 14 and 15, Gravley discloses a reactor having a supply of a reaction mixture via channels of a burner block to a reaction chamber (see Gravley, column 3, lines 15-16), a high temperature reaction having a short residence time taking place in the reaction chamber (see Gravley, column 7, lines 56-60) and the reaction mixture subsequently being rapidly cooled in a quench area (see Gravley, column 6, lines 37-39), characterized in that the transition of the reaction chamber to the quench area is designed in the form of an annular gap (see Gravley, Figure).

Gravley does not disclose a reactor characterized in that the alumina content of the fire-resistant ceramic is at least 95% by weight.

However, Bakker discloses a refractory material made from a high purity alumina refractory brick batch mix consisting of 85% – 95% alumina by weight (see Bakker, column 2, lines 10-12). Bakker discloses that the refractories of his invention are of increased strength, higher density, lower porosity, and higher refractoriness than other refractories commercially available (see Bakker, column 1, lines 62-67).

10/806,232 Art Unit: 1797

Therefore it would have been obvious to the person having ordinary skill in the art at the time the invention was made to incorporate the refractory of Bakker into the reactor of Gravley so as to provide for a more durable refractory sufficient for use under high reaction temperatures.

- 30. With respect to claims 16 and 17, Bakker discloses a fire-resistant ceramic shaped into bricks, compressed, dried, and calcined (see Bakker, column 3, lines 58-70).
- 31. With respect to claims 18 and 24, Bakker discloses pressing the refractory mix into any desired shape (see Bakker, column 3, lines 58-59).

Double Patenting

32. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Omum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422

10/806,232 Art Unit: 1797

F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

33. Claims 3, 13-19, and 24 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-7 of Bartenbach (US 6869279). Although the conflicting claims are not identical, they are not patentably distinct from each other because both recite the same reactor device.

Examiner notes that claim 1 of the '279 patent does not recite the limitation of claim 3 of the present application, namely a reactor "characterized in that the transition of the reaction chamber to the quench area is designed in the form of an annular gap." However, the person having ordinary skill in the art would recognize that such a gap is necessarily present in the reactor of the '279 patent, since there must be some separation of space (i.e. a "gap") between the reaction zone and quench zone. Moreover, such gap would necessarily be "annular" in shape given the reactor design

10/806,232 Art Unit: 1797

disclosed in the '279 patent. Such being the case, the aforementioned claims of the present application are not patentably distinct over those of the '279 patent.

Response to Arguments

- 34. Applicant's arguments filed 5 November 2007 have been fully considered but they are not persuasive.
- 35. Examiner understands Applicant's principal arguments to be:
 - I. Gravley does not disclose the identical process for the scale-up of a reactor as in Applicant's claim 1.
 - II. Gravley does not disclose the identical reactor of Applicant's claim 3.
 - III. Gravley's "passage" bears no resemblance to Applicant's "channels of a burner block."
 - IV. Gravley's "throat" bears no resemblance to Applicant's "gap."
 - V. Neither Kuehner nor Bakker provides any reason to modify Gravley to provide a supply of reaction mixture via channels of a burner block to a reaction chamber.
 - VI. Neither Kuehner nor Bakker provides any reason to modify Gravley to provide a transition from the reaction chamber to the quench area designed in the form of a gap or annular gap.
 - VII. With respect to the nonstatutory obviousnesstype double patenting rejection, the patent to Bartenbach (US 6,869,279) does not disclose a transition of the reaction chamber to the

10/806,232 Art Unit: 1797

quench area designed in the form of an annular gap.

36. With respect to Applicant's first, second, third, and fourth arguments, Examiner notes that the arguments are directed to the rejections of claims 1-13 and 20-22 under 35 U.S.C. 102(b). In response to Applicant's arguments, Examiner submits that all claim limitations of claims 1-13 and 20-22 are reasonably disclosed (either explicitly or inherently) by Gravley. Examiner notes that Applicant has defined the claims broadly and has provided no special definition for either "channel" or "gap." Consequently, Examiner interprets "channel" to be synonymous with "passage," and "gap" to be synonymous with "a break or opening" or "an empty space or interval."

Finally, Examiner finds Applicant's arguments that Gravley's "passage" and "throat" "bear no resemblance" to Applicant's "channels" and "gap" unpersuasive and irrelevant inasmuch as the court has held it improper to read limitations from a preferred embodiment described in the specification into the claims absent a clear indication that the patentee intended the claims to be so limited. <u>See Liebel-Flarsheim Co. v. Medrad Inc.</u>, 69 USPQ.2d 1801, 1807, 1813 (Fed. Cir. 2004) ("[T]his court has expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment.").

37. With respect to Applicant's fifth and sixth arguments, Examiner finds the arguments to be unpersuasive because Examiner does not rely on Kuehner and Bakker for a teaching of "channels," "gaps," or "annular gaps."

10/806,232

Art Unit: 1797

With respect to Applicant's seventh argument, Examiner submits that "the 38. transition of the reaction chamber to the quench area designed in the form of an annular gap" is inherent within the disclosure of Bartenbach ('279) since there must necessarily be some separation of space (i.e. an "annular gap") between the reaction zone (4) and quench zone (5) of Bartenbach ('279) (see Bartenbach ('279), Fig. 2).

Conclusion

39. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the 40. examiner should be directed to Randy Boyer whose telephone number is (571) 272-7113. The examiner can normally be reached Monday through Friday from 10:00 A.M. to 7:00 P.M. (EST).
